

Catalogued gas flare sites, Gulf study region

EOG VIIRS record, most recent observation per site | 2,490 sites | 2012–2024

Marker area scales with log volume: a linear scale would make the small-flare population invisible. 1,631 of 2,490 sites (66%) fall below the 3.15 Mm³/yr VIIRS detection limit (Seymour et al. 2025, assuming continuous flaring). EOG volumes are VIIRS-derived and are not independent evidence for sites the record omits.
